Re: GiantRobot Mark 1

We have completed the intellectual property audit for GiantRobot Mark 1. We have found numerous patents that can be related to its design and operation. We present some of the most relevant ones:

- Pat. US12A6429: "Laser targeting of rocket-propelled long-range missiles.", Google
- Pat. US946Z358: "The methods and apparatus for preventing friendly fire in unmanned aerial vehicles.", Google
- Pat. US03656G3: "Hydraulic systems for improved mobility of robotic systems.", Google
- Pat. US56X8264: "The methods and apparatus for navigating rough terrain", Google

Unfortunately we had to conclude that the number of patents granted to Google as well as resources at its disposal for legal persecution it would be impossible to operate GiantRobot Mark 1 without a significant drain on our resources that could delay or even prevent world domination.

We have worked with the Research to put together a design that could be deployed without infringement considerations and GiantRobot Mark 2 is cleared from the IP standpoint.

It is our recommendation that once the global government control is establish to revamp the patent system to allow faster design, development and deployment of the Giant Robots.
